

# ODOUR ASSESSMENTS AND AMBIENT MONITORING AT THE WASTEWATER TREATMENT PLANTS AND THEIR CHALLENGES

Presented By:  
Anna H. Bokowa, M.Sc.  
Environmental Odour Consulting  
CANADA

# Overview

- ◆ Principles and Challenges when Assessing Odours at the WWTP
- ◆ Introduction to Odour Sampling:  
*How do you measure odour?*
- ◆ Standards and Guidelines for Odour Sampling
- ◆ Methodologies Commonly used to Estimate Odour Emissions from the Area Sources
- ◆ Case Study
- ◆ Conclusions

# Challenges when Assessing Odours at WWTP

- ◆ Difficulty in Accurately Measuring Emissions from Potential Odour Sources
- ◆ Sources at WWTP
  - ◆ Point Sources (vents, stacks)
  - ◆ Area Sources:
    - 1. Active Surface Sources with Noticeable Flow (Aeration Tanks)
    - 2. Passive Surface Sources- without Flow
    - 3. Partially Passive, Partially Active
  - ◆ Fugitive - (Open Doors, Truck Waiting to Load/Unload)

# Odour Sampling at the Sources

## **How Do You Measure Odour?**

- Collection of Samples at Each Potential Odour Source
- Olfactometry Evaluation for Odour Detection Threshold Values (ODTV)
- Estimation of Odour Emission Rates
- Dispersion Modeling Analysis to Predict Off-Site Odour Concentrations

# Standards/Guidelines for Sampling

- ◆ **European Standard:** *EN:13725:2003*  
Air Quality-Determination of Odour Concentration by Dynamic Olfactometry
- ◆ **Australian/New Zealand:** *2001 Stationary Source Emissions. Part 3: Determination of Odour Concentration by Dynamic Olfactometry*
- ◆ **German VDI** (Verein Deutscher Ingenieure): *VDI 3880;2011*  
Olfactometry - Static Sampling;
- ◆ **United States of America:**  
*ASTM -679*
- ◆ **Canada, Ontario:** *Ontario Source Testing Code, Method ON-6 "Determination of Odour Emissions from Stationary Sources"*

# Methodologies Used for Estimation of Emissions From Point Sources

- ◆ Dilution Sampling Method- samples are diluted with nitrogen ( on site) using dynamic dilution sampler
- ◆ Sampler- calibration, check for leakage, odour sampler blank
- ◆ Lung Sampling Method- samples are not diluted

# Methodologies Used for Estimation of Emissions From Area Sources

- ◆ Flux Chamber Method
- ◆ Wind Tunnel Method
- ◆ A Back Calculation with Air Dispersion Model Method
- ◆ A new Method- Based on the Principle of Mass Transfer from Liquid to Gas Phase- 2015 A&WMA Conference

# Flux Chamber Method

# Flux Chamber Method

# Flux Chamber Method

- ◆ Nitrogen Used as a Sweep Gas
- ◆ Sample Collected at the Outlet of the Chamber
- ◆ Three Samples Collected Which May be Diluted on Site
- ◆ Purging of the System before Collection of the Samples
- ◆ Nitrogen Flow used Together with ODTV for Calculations of Emission Rates

# Portable Wind Tunnel Method

**DynaTunnel portable wind tunnel**

# Portable Wind Tunnel Method

# A Back Up Calculation with Dispersion Modelling

- ◆ Ambient Concentrations are Measured Downwind at Several Downwind Locations
- ◆ Samples - Analyzed Using Dynamic Olfactometry - According to EN137125
- ◆ Back up Calculations of Emission Rates using a Dispersion Model
- ◆ Large Number of Samples are Required to be Collected During Different Meteorological Conditions
- ◆ Sources Need to be Separated

# A Back Up Calculation with Dispersion Modelling

# Method Based On Mass Transfer from Liquid to Gas Phase

- ◆ Samples Collected Using a Flux Chamber acted as Capture Hood
- ◆ Assumption that Transfer of Gases Between Water and Air – Directed by Turbulent and Molecular Process
- ◆ Full Description of Methodology in the Paper: Liu H., Bokowa A. “Explore an Approach to Determine Odour Emissions from Water Surfaces”, 2015 A&WMA

# Ambient Odour Assessments- Ambient Sampling

- ◆ Ambient sampling with odour panel evaluations - very common approach used in Ontario, Canada to assess odours in residential and complaint areas - not expensive, reliable data, needs clean bags
- ◆ Downwind and upwind locations
- ◆ 3 samples collected at each ambient location
- ◆ All samples analysed by dynamic olfactometry using 8 trained and screened panelists

# Ambient Sampling

# Ambient Odour Assessments- Portable Units

- ◆ Odour monitoring using portable instruments such as the Nasal Ranger or Scentroid SM100 - inexpensive can be used as a screen tool.
- ❖ Provide peak instantaneous odours, whereas ambient sampling provides odour concentrations averaged (10 minutes, 30 minutes)
- ❖ Readings are based on one - person sensitivity

# Ambient Odour Assessments- Electronic Noses

- ◆ Continuous odour monitoring using electronic noses
- ❖ Very expensive
- ❖ Not applicable for all types of sources
- ❖ Calibration with odour panel
- ❖ Frequent replacement of the sensors
- ❖ Question? What to do when process changes

# Ambient Odour Assessments- Specific Compound Monitoring

- ◆ Continuous specific compound or a group of compounds monitoring (H<sub>2</sub>S, RSC monitoring systems)
- ❖ Some of these systems are easy to operate but most of them are complex and installation and operation require extensive technical expertise
- ❖ Limitations with detection limits
- ❖ Possible interference

# Ambient Odour Assessments- Specific Compound Monitoring

- ◆ Continuous specific compound or a group of compounds monitoring (H<sub>2</sub>S, RSC monitoring systems)
- ❖ Some of these systems are easy to operate but most of them are complex and installation and operation require extensive technical expertise
- ❖ Limitations with detection limits
- ❖ Possible interference

# Ambient Odour Assessments- Grit or Plume Method

- ◆ Ambient monitoring using grit or plume method-observations are made by a panelist who performs odour observations for odour intensity following grit or plume methods.
- ◆ Very expensive method
- ◆ Requires large data base and therefore requires months of observations.
- ◆ Most data are based on a one - person observation and depends on his or her sensitivity.

# Ambient Odour Assessments- Community Odour Surveys

- ◆ Community odour surveys - performed by screened and trained independent observers downwind from the potential source, namely the facility in question. Intensity, hedonic tone and character is recorded
- ◆ A large data set is required
- ◆ Odour adaption and fatigue
- ◆ Limitations with terrain

# Ambient Odour Assessments- Community Odour Surveys

- ◆ Intensity Scale

- ◆ 0 - No odour - No Odour Perceived
- ◆ 1 - Slight Identifiable Odour
- ◆ 2 - Moderate Identifiable Odour
- ◆ 3 - Strong Identifiable Odour
- ◆ 4 - Extreme - Severe Odour. One Where the Observer is Compelled to Leave the Area

# Community Odour Surveys

| Category       | Frequency of Occurrence of Odour (%) |     |     |      |      |      |      |      |
|----------------|--------------------------------------|-----|-----|------|------|------|------|------|
|                | Distance (m)                         |     |     |      |      |      |      |      |
|                | 250                                  | 500 | 750 | 1000 | 1250 | 1500 | 1750 | 2000 |
| Stagnant Water | 28                                   | 21  | 22  | 20   | 3    | 0    | 0    | 0    |
| Raw Sewage     | 63                                   | 61  | 23  | 16   | 6    | 0    | 0    | 0    |
| Burnt Sewage   | 4                                    | 9   | 22  | 12   | 2    | 12   | 0    | 0    |
| Sulphur        | 2                                    | 0   | 0   | 0    | 0    | 0    | 20   | 8    |
| Mercaptans     | 0                                    | 0   | 0   | 0    | 0    | 0    | 0    | 0    |
| Acidic         | 0                                    | 0   | 0   | 0    | 0    | 0    | 0    | 0    |
| Pungent/oily   | 2                                    | 0   | 0   | 7    | 4    | 2    | 0    | 0    |
| Other          | 0                                    | 0   | 3   | 0    | 0    | 0    | 1    | 0    |
| Total          | 99                                   | 91  | 70  | 55   | 15   | 14   | 21   | 14   |
| No Odor        | 1                                    | 9   | 30  | 45   | 85   | 86   | 79   | 86   |

# Community Odour Surveys

|  | Nominal Distance from Plant Centre (m) |     |     |      |      |      |      |      |

| FREQUENCY OF<br>DETECTION<br>(AVERAGE INTENSITY) | 99%                                    | 91% | 70% | 55%  | 15%  | 14%  | 21%  | 14%  |
| Maximum Intensity**                              | 4.0                                    | 4.0 | 3.0 | 3.0  | 1.7  | 2.0  | 2.0  | 1.0  |

# Methodology Used for Case Study 1

- **Flux Chamber Method** - 2 locations, 3 samples each
- **Wind Tunnel Method** - 2 locations, 3 samples each
- **Mass Transfer Method Flux Chamber** - 2 locations, 3 samples each
- No Back Up Calculation Method Used

# Methodology Used for Case Study1

- ◆ In Addition – Ambient Sampling at 3 Selected Sensitive Receptors
- ◆ One Upwind Location for Each Sensitive Receptor was Chosen for Sampling as a Background
- ◆ 2 Conditions
- ◆ 3 Samples Collected at each Ambient Location (Downwind and Upwind)
- ◆ All Samples Analyzed at EOC Laboratory using 8 Screened Panelists

# Methodology Used for Case Study 1

- Samples Covered in Dark Containers to Prevent Any Photochemical Reaction
- Evaluations of Samples by Dynamic Olfactometry and Screened Panelists
- Evaluations According to EN 13725 Standard (*Some Exceptions*) and Ontario ON-6 Guideline
- Evaluations Within 8 Hours From Collection

# Case Study 1-Results

| Location/Condition                      | Measured Ambient Concentration<br>OU | Predicted Ambient Concentration<br>OU<br>Flux<br>Method | Predicted Ambient Concentration<br>OU<br>Wind Tunnel<br>Method | Predicted Ambient Concentration<br>OU<br>Mass Transfer<br>Method |
|---|--------------------------------------|---|--|--|
| Sensitive Receptor1-<br>Condition 1     | 13                                   | 2   | 12   | 14   |
| Sensitive Receptor-<br>2<br>Condition 1 | 10                                   | 1   | 6  | 14   |
| Sensitive Receptor<br>2-Condition 2     | 69                                   | 7   | 43   | 63   |
| Sensitive Receptor<br>3-Condition 1     | 55                                   | 5   | 30   | 45   |
| Sensitive Receptor-<br>3-Condition 2    | 138                                  | 14  | 64   | 73   |

# Conclusions- Case Study 1

- ◆ Back Up Calculation Method Was not Used – It was Not Possible to Differentiate Area Sources - Some of Them were in Line with Specific Wind Directions
- ◆ Good Correlation Between Measured Ambient Concentrations and Concentrations Obtained by Mass Transfer Method and Wind Tunnel Method
- ◆ Flux Chamber Method – Underestimation of Odour Concentrations
- ◆ Careful Selection of the Methodology Should be Considered when Sampling for Odour at the Area Sources

# Case Study 2

| Sample No: | Dilution | Raw ODTV<br>ou | Net ODTV<br>ou |
|------------|----------|----------------|----------------|
| Sample 1   | 50       | 620            | 31,000         |
| Sample 2   | 50       | 650            | 32,500         |
| Sample 3   | 50       | 710            | 35,500         |
| Sample 1   | 1        | 2,100          | 2,100          |
| Sample 2   | 1        | 1,900          | 1,900          |
| Sample 3   | 1        | 2,150          | 2,150          |

# Case Study 3

| Sampling<br>Description/Location | Odour Detection Threshold Values (OU) |                     | Factor |
|----------------------------------|---------------------------------------|---------------------|--------|
|                                  | Dynamic Dilution<br>Method            | Lung Sampler Method |        |
| Hot Source-Location<br>1         | 34,294                                | 2,075               | 16     |
| Hot Source-Location<br>2         | 1,588                                 | 124                 | 13     |
| Humid Source-<br>Location 1      | 9600                                  | 1100                | 9      |

| Sensitive Receptor 3 | 15  | 18  |
| Sensitive Receptor 4 | 82  | 126   |

# Case Study 7

## 💧 Odour Removal Efficiency Study

### Consultant A

|               |     |
|---------------|-----|
| 💧 Condition 1 | 4%  |
| 💧 Condition 2 | 0%  |
| 💧 Condition 3 | 53% |
| 💧 Condition 4 | 75% |

### Consultant B

|     |
|-----|
| 98% |
| 96% |
| 79% |
| 96% |

# Conclusions

- ◆ Several factors should be considered before or during assessments and these include:
  - ◆ Selection of all potential odour sources in the facility ( point, area, fugitive)
  - ◆ A careful selection of the methodology especially for fugitive and area sources
  - ◆ Determination of any odour background before assessment

A full odour assessment is recommended for wastewater treatment plants including source testing and ambient assessment

# Conclusions

- ◆ Odour emissions may be underestimated if proper sampling methods are not used which may produce outgoing complaints
- ◆ Odour removal efficiencies may be underestimated if proper sampling methodology is not used
